

MEMORY DISORDERS

There is help available for memory disorders.

Both old and young people can be forgetful. Almost everyone occasionally forgets names or that they have already told someone the same thing before. There may be various reasons for this. Most of the causes of memory loss can be treated. Memory disorders are common for both working age and old age.

Memory disorder may be caused by:

MAJOR CHANGES IN LIFE CIRCUMSTANCES, SUCH AS IMMIGRATION

TRAUMATIC EXPERIENCES

MISUSE OF MEDICINE, ALCOHOL, CIGARETTES OR DRUGS

DEPRESSION, LONELINESS AND FEELING DOWNHEARTED

INSOMNIA, TIREDNESS, FATIGUE

Depression and insomnia weaken your memory, because they worsen your ability to be alert and concentrate. Depressed individuals struggle to focus on learning.

STRESS AND ANXIETY

Stress and worries overload your working memory. Prolonged stress may lead to fatigue and depression that in turn are risk factors for dementia and Alzheimer's.
